

Clinically Tested for Sleep

TESTED RESULTS

Transepidermal Water Loss Study

Clinical study demonstrated use of Tranquility® Premium OverNight™ Underwear and ATN™ (All-Through-the-Night) Briefs vs. an industry-average moderate absorbency brief resulted in fewer resident interruptions, especially at night, allowing longer intervals of sleep.

Resident Sleep Study

Extended Tranquility Product evaluation produced uninterrupted sleep for residents, further resulting in decreased anger issues, increased compliance, reduction in anti-psychotic drug usage and decreases in transfers to acute- and psychiatric-care facilities.

West Coast VA Facility Product Evaluation

Evaluation of Tranquility Premium underwear, briefs and underpads resulted in 100% consensus that Tranquility provided improved sleep and longer intervals of sleep for residents.

Midwest VA Facility Product Evaluation

Veterans who wore Tranquility Products were able to sleep most nights without having to be changed.

IN THEIR OWN WORDS

Caregiving professionals at three Midwest LTC communities shared these testimonials after evaluating Tranquility Products:

"Residents have been sleeping longer ... which allows them to be more active during the day."

"Residents all talked about being more dry and feeling like they slept better because of it."

"I loved knowing that my residents were happy the whole night and felt dry, longer."

Additional Information

Read about additional Tranquility Product Evaluations at our Clinical Portal Trials and Studies page.

See how integrating Tranquility into your community's incontinence management plan can extend sleep times and improve overall quality of life for your patients and residents.
